Abstract (en)

[origin: EP1055389A2] The dishwasher has a device (10) for drying dishes, whereby the dishes are heated by circulated hot cleaning liquid and the moisture in the washing chamber and on the dishes is condensed during the drying process by a heat exchanger in a closed circuit with the liquid pumped out. The device has a container (11) filled with cold fresh water or regenerated flushing water during the drying process as the heat exchanger and an air channel (12) with a circulation fan (13) carrying the process air out of the was chamber (3) in a closed circuit during drying and leading past the container. At least one side wall (15) of the container acts channel wall forming a condensation surface.
