Abstract (en)

[origin: EP1055625A2] The second speeding sector (112) has a drive (120,122) with pre-set contact area (124) to make friction contact with the pri signatures and divert them sideways and the general feed sector includes a transport belt (106) for feeding the printed sheet as interleaved flow. The sheets are fed in synchronism to the feed sector by an underneath belt (118) forming part of the drive (120,122). Specifically the speeding sector (112) offers two belts (120,122) whose raised sector (124) or sectors (124) form the contact area. The belts and sector (112) complete a transport section (114) to move the sheets on at an angle to the first secto (104) and whose sector (116) further angles the sheets relative the line of sector (114), using an angle complementary to the an of sector (114).
