Abstract (en)

[origin: WO9938531A1] The invention relates to a pharmaceutical composition for treatment of atopic dermatitis comprising a suitable IgE antagonist which does not induce release of the mediators of allergy; for example, anti-IgE antibodies which bind to secreted IgE, to membrane IgE on the surface of IgE-producing B cells, but not to IgE bound to the Fc epsilon RI on the surface of basophils or mast cells. Preferably, these antibodies also do not bind to IgE bound to Fc epsilon RII receptors. It is also preferable if these antibodies have human IgG1 or IgG3 constant regions, as well as further human portions, if desired. The pharmaceutical composition can be administered systemically or topically.
