Abstract (en)

[origin: WO9918577A2] A method for recording and storing received signals, e.g. sound signals, in connection with a telephone apparatus receiving said signals from a remote apparatus. The telephone apparatus also receives information about the telephone number of the remote apparatus, to which it is interconnected through a telephone network, with the purpose of being capable of playing back the stored signals at a later stage. It is intended to indicate a new method for simplified storing of information which, upon being played back, can identify the caller when the calling telephone number is received over the telephone line. The recording of e.g. sound signals (voice) from said remote apparatus and/or the telephone apparatus called, starts when a telephonic connection has been established with a remote apparatus, and stops after a predetermined time, whereupon the telephone number of the remote apparatus is stored searchably in the data storage medium.
