Abstract (en)
This support is constructed from a platform which is rectangular and hollow (1) in whose vertices tubular elements (4) are established for coupling with pillars (5), with the peculiarity that it also incorporates a pair of intermediate pillars (5'), which define two location areas for the placement of each barrel (6) which is supported on the platform with the collaboration of rods (7) which stabilise said barrels. Complementarily on the bottom of the platform there are pivots established (8) which couple in the pillars (5) in the stacking of supports, but with these pivots (8) dephased respecting the pillars (5), which permits that in stacking the supports, the same are alternatively dephased and, more precisely, that the barrels (6) adopt a quincunx formation, determining optimum accessibility to each and every one of them, upon each barrel adopting an intermediate position respecting the two situated on the levels above and below it. <IMAGE>
