Abstract (en)

[origin: EP1057955A1] The closure system for doors has a lock unit (4) comprising an operating mechanism (5) for the lock's catch bolt and operated by an outer and inner (3) grip. A connecting rod (7) between the lock unit and the inner grip consists of two rod parts (8,9) joined by a coupling element (10). When the outer grip is operated, the lock-side rod part moves axially, causing the coupling element to swivel out so that the axial movement is not transmitted to the inner grip side rod part.
