Abstract (en)

[origin: EP1057956A1] The bolt (31) in the additional lock (4) works in conjunction with a fixed frame-side stop pivot stirrup (47). The drive bar-operated back closure occurs as the result of a sliding away of a counter control surface (18) on a key-operated control surface (23) and the pre-closure is made possible by a special handling arrangement. The control surface and the counter control surface are arranged in the main lock (3) and the drive bar (24) is shifted by the handling operation. The movement of the control surface is derived from the bolt movement.
