Abstract (en)

[origin: DE19860042A1] The invention relates to an actuating element (3) for producing a switching connection between a drive element (5) of a main switch (1) and an actuator (6) of an auxiliary switch (2). This arrangement enables a movement of the drive element (5) to put the actuator (6) in a particular switching state by means of the actuating element (3). According to the invention, the actuating element (3) can be clamped in order to help restore the actuator (6) to its original switching state and ensure that said actuator (6) is easily restored from the particular switching state to the original switching state.
