Abstract (en)

[origin: EP1059252A1] The detector (15) operates between upper (20) and lower (21) limits of stack (7) height. Its signal is stored in the evaluation and control unit (17), which operates a motor (10) controller (18), hence controlling stack lifting. A further sensor (22) detects stack level below the lower limit (21), generating a further signal to the controller (17). Canceling of the stored control signal adjusts motor drive to a mean level.
