Abstract (en)
[origin: EP1059410A2] The rolling gear has a roller support (5) moving in a track rail and a disc-like support body (3) for insertion in the sliding door. The support body has at least one bolt (15) which can be moved outwards beyond the sleeve face of the cylindrical part (11) of the support body for adjoining the bore in the door, and can then be locked in this extended position. The bolt extends in a diagonal of the support body either side through recesses (25).
