Abstract (en)

The winder for the strap (2) of a shutter includes a strap winding and tensioning part (3) located inside a casing formed from two shells (4, 8). Each shell comprises an edge frame (44, 84) extending in a direction perpendicular to a principal shell web (41, 81). These edge frames are mutually engaged by a relative translation in a direction parallel to the respective webs so that the edge of the first shell is surrounded by that of the second shell. The external surface (44 a) of the first edge has reliefs (44 b) which engage corresponding reliefs (84 b) in the internal surface of the second edge.
