Abstract (en)  
[origin: US6305827B1] A transportable lamp 1 comprises at least one lighting device, which is received in a holding device 2 and acted upon by voltage via a feed cable. The lighting device has an at least partly transparent lamp screen. So that the lamp screen 3 can be continuously and safely opened, a holding device is designed in the form of a bar and at least partly enclosed by the lamp screen. The lamp screen is held by movable tensioning means which, during use, are moved away from the lighting device, abutting the curvature of the lamp screen. Continuous and safe opening of the lamp screen is achieved under difficult working conditions, because the lamp is extremely robust and insensitive to damage.
