Abstract (en)
[origin: WO9944907A1] The inventive container (2) has a sealing cap (15) for the discharge nozzle (1) and a discharge opening (8) which is sealed by a membrane (11). Said discharge nozzle (1) has a discharge body (4, 5) with a discharge channel (3) and a connecting element (6) for connecting the discharge body (4, 5) to the discharge opening (8) of the container (2). An element (10) is provided for piercing the membrane (11) during or after the connection of the discharge body (4, 5) to the discharge opening (8) of the container (2). This element (10) is configured as a part of the discharge body (4, 5). An opened container is therefore much easier to reseal.
