Abstract (en)

The present invention refers to a holder for carrying a small bottle and accompanying glass in an upright position, in particular for serving a glass and small bottle containing a drink of which the contents can be partly poured in the glass beforehand. The holder is designed for carrying one small bottle and one glass and comprises to this end two placement units (1) in which in the first the glass and in the second the small bottle is placed in an upright position. Both placement elements (1) provide respectively a side support for the glass and the small bottle so that these cannot fall over. The holder further comprises a carrying element (2) which extends higher than the placement units and is provided with a handle (3) placed in such a way that the holder hangs in balance when picked up by the handle. <IMAGE>
