Abstract (en)
The invention relates to electronics and can be used in constructions of electronic units performing the reception and processing of signals of the satellite radio navigation systems (SRNS). The essence of the invention consists in that in a electronic unit comprising a multilayer printed-circuit card, the conductors intended for screening the corresponding linking signal conductor are disposed at both its and are connected with the ground planes by means of metallized holes of interface connections made at least at the beginning and end of each screening wire to form a closed electric circuit. <IMAGE>
