Abstract (en)
[origin: FR2775924A1] The mold (M) consists of an inflatable structure which, when inflated has a tubular shape with an internal cylindrical surface (S1) forming a molding volume (v). When extraction from the mold cannot be affected through deflation, the structure can include a longitudinal axial slot (F) extending through the wall. The mold is closed by means of a zip fastener (E) located in the internal surface and eyelet's (O) and a lace (L) on the external face
