Abstract (en)

[origin: WO9940373A1] The present invention comprises a device for storing and/or heating fluid, comprising: an outer jacket (41); an inner jacket (42) arranged in the interior of the outer jacket (41); and an intermediate jacket (43) arranged between the outer jacket (41) and inner jacket (42) which is formed and arranged between the inner jacket (42) and the outer jacket (41) such that channels are formed in the intermediate space between the inner and outer jacket in which fluid for heating and heating fluid can be fed through such that heat exchange takes place between these two fluids. The present invention also comprises a device for discharging gaseous medium from a fluid flow, comprising: a first channel for fluid possibly provided with gaseous medium; a secondary channel which extends substantially in the direction opposed to the first channel and which debouches close to a secondary inlet of the first channel.
