Abstract (en)  
[origin: WO9946954A2] ATM (Asynchronous Transfer Mode) transmission system, comprising mutually connected transmission exchanges, transmission nodes connected via virtual transmission paths with these exchanges and access means connectable to these transmission nodes via virtual transmission channels. Data are exchanged in packet or cell form via a transmission combination comprising a virtual transmission channel and a virtual transmission path, in which a transmission node is provided connection means for exchanging data with an accompanying transmission exchange via a transmission combination comprising a pre-assigned or default-virtual transmission path. The connection means can comprise a routing table for selecting assigned virtual transmission paths via pre-adjustable routing data.
