Abstract (en)

[origin: EP1063361A2] The counter-piece (12) for the coupling section (7) of the connection part (1) secured to the building (9) forms an undercut, against which the coupling section abuts when the pre-fabricated element (6) is secured to the building. A connection part is used to secure a pre-fabricated building element, preferably a concrete slab, to part of a building, and comprises a section (3) subjected to tensile forces, a section (4) subjected to press forces, and a strut arrangement (5) for absorbing cross-direction forces. A coupling section is formed at the free end of the section of the part subjected to tensile forces. A receiving fixture (2) for the connection part is provided in the building and comprises a press part (11) for directing press forces into the building, a tensile part (10) at least partially anchorable inside the building in order to direct tensile forces into it, and a counter-piece for the coupling section, used to engage the latter with the fixture. Independent claims are also included for (a) the connection part, (b) the receiving fixture, and (c) a method for mounting a pre-fabricated element.
