Abstract (en)

The present invention concerns a method for determining the needed transmission power for establishing a radio communication link between a transmitter unit (Ei) among a plurality of transmitter units (E) gathered together in several geographically spread base stations and a receiver unit (Rj) among a plurality of receiver units (R), with a given signal-to-interference ratio (SIRR<sub>j</sub>) at the receiver unit (Rj), wherein the transmission power (P<sub>t</sub>), especially the initial transmission power (P<sub>t,init</sub>) is calculated as follows: <MATH> where: PL is the pathloss obtained as the ratio between reported received power (P<sub>Rj</sub>) at the receiver unit (Rj) and known transmitted power (P<sub>t</sub>) by the transmitter unit (Ei) ; I<sub>intra</sub> is the interference power received at the receiver unit (Rj) from all other transmitter units (EBS) of the base station (BS) comprising the transmitter unit (Ei), and, I<sub>extra</sub> is the interference power received at the receiver unit (Rj) from the transmitter units (E) from all base stations of the network, except the base station (BS) incorporating transmitter unit (Ei).
