Abstract (en)
[origin: DE19811570A1] The light outlet plane consists of a middle section (10), permeable nearly unimpaired for a part of the available light yield of the light source. In addition a ring shaped outer section (20) surrounding the middle section, which is permeable solely, for the available residual part of the light yield. The reflector (2) is positioned relative to the light source in such a manner, that the core light reflection is projected on the middle section of the light outlet surface, and illuminates the remaining scattered light yield of the outer section (21).
