Abstract (en)

[origin: FR2776936A1] The invention concerns an in-line roller skate comprising: a boot (2) provided with a sole portion (21); a frame (3) extending along a longitudinal direction (I-I') whereon is directly mounted the sole portion (21); a series of at least three aligned wheels (4, 40, 41, 42, 43) integral with the frame (3). The invention is characterised in that the frame (3) comprises a rigid central portion (30) whereon is mounted at least one central wheel (40, 41), and at least an end portion (31, 32), whereon are mounted one or several wheels (42, 43) arranged relatively to the central wheel (40, 41) in a position further from the frame median vertical transverse plane (P); said end portion (31, 32) being mobile relative to said central portion (30) along a longitudinal direction. One of the aims of the invention is to enable the frame to be adjusted lengthways while maintaining its rigidity as much as possible.
