Abstract (en)

[origin: WO0043584A1] The invention relates to a fastening system for a panel part of a control panel of a laundry treating machine with a control panel section fastened to the housing and a component such as a detergent dispensing compartment or a condensate receiver tank which is displaced with respect to the housing like a drawer. The invention also relates to the panel part arranged on said fastening system which panel part interacts in the inserted state of the component to give a flush-surface panel with the control panel section. The aim of the invention is to provide a fastening system for the displaceable panel part at a displaceable component such as a condensate receiver tank or a detergent dispensing compartment which makes it possible to adjust the displaceable panel part vis-à-vis the fixed control panel section during assembly. To this end, the fastening system for the panel part is configured with adjustment washers and bearing elements that float and/or oscillate in respect of one another in a position- and tolerance-compensating manner.
