Abstract (en)

[origin: DE19813316A1] The invention relates to an actuating device with a hinged handle (40). A support pin (26) for a flap (30) which can be hinged thereon is mounted on a support (20) positioned on the inner side (14) of the door. The handle (40) is joined to the flap (30) by means of two fixing points which are positioned at the ends. Two links (21, 22) are situated between the handle (40) and the flap (30) which pass through an opening (11, 12) in the door (10). To allow for simple assembly of the device, the invention provides for the first fixing surface on the first link (21) to be configured as a pivot bearing, which consists of a pivot (41) and a seat (31) which can be inserted on top of each other vertically to the door plane (36). The handle (40) can be rotated about this axis of rotation (35) until the parts (23, 24, 42) belonging to the second fixing point on the second link (22) are aligned in relation to each other. These aligned parts (23, 24, 42) can then be joined without problem.
