Abstract (en)  
[origin: EP1067055A2] The invention is a package for foodstuff which is for cooking by means of microwaves. The package is constructed to serve as the means in which the foodstuff is contained as microwave cooking takes place. To this end the package has microwave active material to focus heat onto the foodstuff in the package. Typically, the microwave reactive material is receptor material in sheet form. The invention provides that the package is adapted to be reconfigured usually by tearing it, and enabling the foodstuff to get closer to the receptor, or into contact with it. <IMAGE>
