Abstract (en)
[origin: WO0046580A1] A transducer has a closure for components mounted on the substrate (13) comprising: a lid component (16); and a peripheral component (17) of plastics material secured by one side to the lid component (16) and by the other side to the one side to the substrate (13); the lid component (16) and the peripheral component (17) serve to define a hermetically sealed enclosure (18) for the electrode structure (12). The invention further comprises a workpiece bearing the transducer to enable strain generated in the workpiece to be examined by way of the transducer.
