Abstract (en)

[origin: EP1071058A1] Data are provided at several measurement locations in the traffic network, relating to several time points within a time period extending backwards from the current time. The variations with time of several data detected in the past are used to determine local state data representing the current state of the traffic network. The state of several road sections may be determined e.g. using stationary sensors. An Independent claim is included for an apparatus for performing the method.
