Abstract (en)
[origin: WO9937569A1] Arranged inside a housing (33) of the inventive device (1) are a supply spool (2) for a carrier band (5) coated with the film (4), a winding spool (3) for accommodating the carrier band (5) separated from the film (4), and an application device (6) which diverts the carrier band (5). The application device (6) protrudes with an end (8) thereof, said end diverting the carrier band (5), out of the housing (33) and can pivot about the longitudinal direction of the carrier band (5) which is guided through and out of the housing (33). The carrier band (5) runs in an unsupported manner from the supply spool (2) to the application device (6). Despite the pivotability of the application device, there is virtually no risk of the film applied on the carrier band from being damaged or from being prematurely detached from the carrier band.
