Abstract (en)  
[origin: WO9952926A1] Methods and compositions for screening compounds for potential therapeutic activity and for identifying drug targets are provided. The methods rely on controlled expression (either underexpression or overexpression) of an essential cellular gene, which can be achieved, in one embodiment, by fusion of a heterologous regulatory element to the gene. The method is capable of identifying a drug target in the absence of any knowledge of target function.
