Abstract (en)

[origin: EP1072948A1] A thermally processed image recording material which comprises, on a support, at least (a) a reducible silver salt, (b) a reducing agent, (c) a binder, and (d) at least one kind of compound having a melting point of 115 DEG C to 180 DEG C and/or a log P value of 3.0 to 7.0 which is selected from the group consisting of polyhalogenated compounds represented by the following formula (1) and dimer compounds thereof: <CHEM> wherein Z<1> and Z<2> independently represent a halogen atom, X<1> represents a hydrogen atom or an electron withdrawing group, Y<1> represents -CO- group or -SO2-, Q represents an arylene group which may have one or more substituents or a divalent heterocyclic group which may have one or more substituents, L<1> represents -CONH-*, -SO2NH-*, or -COO-* where * represents a bonding site for W, L<2> represents -O-, an alkylene group, an arylene group or a combination thereof, W represents a hydrogen atom, an alkyl group, an alkenyl group, an alkynyl group, an aryl group or a heterocyclic group where the groups mentioned in the definition of W may have one or more substituents, and n represents 0 or 1.
