Abstract (en)  
[origin: WO9958042A2] Specially devised neuronal implants for reconstruction of damaged central nervous system are prepared by culturing embryonal or neonatal tissue explants in a suspension culture with biodegradable microcarriers allowing formation of cellular-microcarrier aggregates. The cellular-microcarrier aggregates are transferred to plastic dishes coated with a matrix gel composed of hyaluronic acid and laminin, and the cellular-microcarrier aggregates are cultured in a suitable culture medium, forming a composite implant suitable for transplantation.
