Abstract (en)

A plate thickness reduction system is provided with a pair of dies 2 provided opposite each other on the upper and lower sides of a slab 1, a swing device 10 that moves up and down the dies symmetrically of the slab via eccentric shafts or crank shafts, upper and lower bearings 21, 22 that support the rotation of the eccentric shafts or crank shafts, and a bearing moving device that moves up and down at least one of the bearings. The bearing moving device is comprised of screw jacks 27 that are fixed to a main frame 26 and drive up and down the shaft boxes 25, or a wedge plate 28 or a step plate 29 that are inserted between and held by the main frame 26 and the shaft boxes 25, thus the thickness of a slab after being highly reduced can be easily adjusted using the same dies. <IMAGE>
