Abstract (en)
[origin: EP0953313A1] A container (1), preferably to a container containing wetted tissues comprising a container body (10) and a lid (11), said lid comprising a stationary lid member (13) and a movable lid member (14). The container comprises at least one elastically deformable strip (15) that extends from the outer side of the movable lid member to the outer side of the stationary lid member. Moreover, the container also preferably features a releasable locking mechanism (25) for securing the movable lid member into the close position, or releasing it by a single finger push into the open position. Furthermore, and since the movable lid member is hingeably connected to the stationary lid member, each hinge housing of the stationary lid member preferably features an angle in its back side to control and fix the opening angle of the movable lid member. Finally, in case the wipes are to be dispensed from a roll, the lid preferably features a slit opening so that the user can dispense a desired length for a wipe and cut it from the rest of the roll. <IMAGE>
