Abstract (en)

[origin: EP1075995A1] The switching points operating method uses a control centre (Z) for assigning a token (Ta) to a train and entering the token in a memory at the switching points (W), the token transmitted from the approaching train to the switching points together with the required switching operation, which is effected upon the token being verified. A second token (Tb) is provided by the switching points after effecting the switching operation and transmitted back to the control centre by the train upon passing the switching points, allowing the second token to be assigned to a following train.
