Abstract (en)

[origin: EP1076030A2] It allows for the programming and transmission of different messages in lifts (1). The programming is carried out from an Information Server Center (2), which also, controls and detects in a centralized manner the possible alarms that are produced in a plurality of lifts (1). The messages may be audio, video and combinations thereof, and they are loaded in a memory (7) (of each lift) together with information that informs the device when the messages have to be transmitted. The message record book of each lift may be personalized separately. When an alarm is produced, the intercommunication system between the lift and the Alarm Center (3) functions, the center which in turn reports the emergency to the different emergency services. It permits communications with deaf people, dumb people or deaf-mutes caught in the lift. <IMAGE>
