Abstract (en)

[origin: WO9958398A1] The air-conditioning of environments such as cabins on passenger ships is performed by means of a static cooling system. Water, particularly chilled water, is used directly for bringing about the thermal exchanges necessary to reduce the temperature in the environment, and is circulated through radiators (1) or similar heat-exchange units disposed in the region of at least one of the walls (W) of the environment to be air-conditioned. There is also provision for possible combination with means (6 to 8) for the supply of a limited quantity of air to the environment in order to ensure the oxygen content, humidity and temperature necessary for the general comfort of the occupants.
