Abstract (en)
[origin: DE19822412A1] Mobile components (21) are connected to compressed air breathers (22) to assess and transfer data via a cordless connection to a base station (20). The base station processes data received from sensors in the breathers and the respiratory equipment carrier. Optical, acoustic or functional signals are triggered independently. Pressure, movement and temperature sensors relay data to the mobile components about compressed air breather pressure, respiratory equipment carrier movement and environmental temperature. The data collected is stored and then transferred later to a computer via an interface.
