Abstract (en)

[origin: WO9958781A1] The invention relates to a frontage system for siding a building, comprising a support (1) made of metal having a filling element support, wherein filling elements (2, 2'), more particularly, laminated glass panel elements, are placed, said elements being fixed by means of outer locking strips (3) that are releasably connected to the support (1), wherein inner sealing elements (4) and outer sealing elements (5) are also provided. The invention aims at ensuring flexible, simple and functional assembly of said system on any metal support (1). To this end, a separate profile rail (7) is provided on the metal support (1) that is placed thereon for fixing the locking strips (3), the profiles of which have a helical groove section (8) directly interacting with fastening screws (6) and at least one additional locking section (9, 9') located next to the helical groove section (8) and fixing the inner sealing elements (4).
