Abstract (en)

[origin: WO9963324A1] In a method for preparing a biological specimen, e.g. by means of staining, fluids which are to be applied to the specimen are atomised with the aid of ultrasound prior to their application. In this way, small drops are obtained which are gentle to the specimen and which are able to prepare the whole specimen quickly and with only a small amount of fluid being required. Between the application of the different fluids the specimen is spun for removing excess fluid so that no mixing occurs of successively applied fluids. A device for carrying out the method is also disclosed.
