Abstract (en)

[origin: EP1079556A2] Data are transmitted between a receiver (1) and an operating and display unit (2) of the radio receiver via a line (3) such as a bus. Radio text contained in received radio signals is decoded in the receiver (1). The decoded radio text is buffered and requested by a software element in the operating and display unit and/or in other components connected to the bus. The software element is informed that the radio text has been completely decoded and buffered. An Independent claim is included for a radio broadcast receiver.
