Abstract (en)
[origin: US6371272B1] A device (10, 10', 50) for furnishing material (12) to work stations is proposed. The device (10, 10', 50) has at least one reservoir, embodied as a chute (14, 14', 54), for the material (12). A discharge point (16, 16', 56) having a gripper tongue (18, 18', 58) adjoins the chute (14, 14', 54). The chute (14, 14', 54) and the discharge point (16, 16', 56) are embodied as parts separably connected to one another. The discharge point (16, 16', 56) can be disposed on one of the two face ends (36, 40, 76, 110) of the at least one chute (14, 14', 54). By means of this arrangement, it is possible with only a few different parts to achieve great versatility in terms of the storage volume of the device (10, 10', 50).
