Abstract (en)
The present invention relates to an electrical detection unit for a railway telediagnosics system which is operationally associated with a plurality of terminal blocks (3) provided with first and second terminals (6, 7) which can be connected together in pairs by means of jumper plugs which are designed to electrically connect electrical apparatus (2) arranged along a railway line to signalling groups (4). The electrical unit (1) therefore comprises a box-shaped body (11) provided with a receiving compartment (12) inside which measuring means (13) electrically connected to the terminals (6, 7) for measuring electrical parameters relating to operation of the apparatus (2) are inserted. This box-shaped body (11) also has electrical input connections (14) for electrically connecting the measuring means (13) to the first and second terminals (6, 7) and electrical output connections (15) for electrically connecting the measuring means (13) to a data storage and processing unit (16). <IMAGE>
