Abstract (en)

[origin: EP1081790A2] The housing comprises connecting chambers, containing a clamping spring (5) coacting with a current rail section (3). The spring is angularly bent to form a clamping edge (8) at the free end of its clamping shank (7). This is directed onto the inserted conductor (6) and hooked onto it. There is an actuator for opening the connection. The free end of the clamping spring has a double bend (10), extending in the direction from the inserted conductor such that the clamping edge does not abut the conductor during reopening.
