Abstract (en)

[origin: EP1081800A2] The connector includes a first connector part (11) comprising a locking ring (13) which holds a locking member (27,29) in engagement with a second connector part (17). When moved into its unlocked position, the locking ring holds the locking member in a release position so that the locking member is disengaged from the second connector part (17). The locking ring may include a forced control part (39), by the action of which the engagement of the locking member with the second connector part is released when the ring is moved to the unlocked position.
