Abstract (en)

[origin: WO9962443A1] A solution-dispensing system is disclosed comprising a sealed container forming an interior chamber to hold an absorbent material holding a sufficient amount of ophthalmic solution for at least one dose of the solution in the form of droplets. The absorbent material is positioned in said chamber such that a converging end portion protrudes from an opening in the container after removing a separable portion of an envelope. The converging portion of said absorbent material forms drops when the package is held with the opening facing down and opposite sides of the package and pressed.
