Abstract (en)

[origin: FR2779090A1] The invention concerns a method which consists in subjecting a blank (8) layer to a laser engraving phase, said layer being produced in a material which has been polymerised prior to said laser engraving phase. The engraving phase is performed by means of a laser (2) operating at a wavelength ranging between 200 and 400 nm. Said method eliminates the need to resort to steps involving exposure to ultraviolet radiation and cross-linking.
