Abstract (en)
[origin: WO9961732A1] In an electronic/electromagnetic lock there is provided an input (113) of a picklock. Via the picklock input an electronic picklock can be connected in order to open the lock if the lock cannot be opened in a normal manner, for example at a power failure. Preferably also power and a reset signal can be connected via the same input. When picklocking the lock at least two and preferably three independent codes are required in order to open the lock.
