Abstract (en)

[origin: WO0058586A1] The device with a double articulation for movable safety lattices for windows and similar consists of a first hinge joint (1, 2) that allows the lateral rotation of a lever arm (4) ending up into a second joint (5) sliding in an opposite guide (6) provided on the horizontal upper and lower sides of the frame (7) of each shutter of the lattice (G) that may therefore be opened and turned so as to leave the window (F) or similar to which said lattice is applied, completely free.
