Abstract (en)
[origin: WO9953375A1] The invention relates to a device in which the light bundle of the projector propagates approximately parallel to the image area and presents an anamorphic compression which strongly compresses the bundle in a dimension perpendicular to the image area. A mirror which is slightly parabolic on one side is positioned at the edge of the image area and reflects the image back onto said image area. In this way the anamorphic compression is compensated by the acute angle of incidence of the light onto the image area.
