Abstract (en)

[origin: DE19936750A1] The converted material container (1) consists of a flat plate with slot and appropriately dimensioned sectors give a container of surfaces (10) and surface extensions (11) to form bottom and side and rear surfaces and also complete a receiver profile (3) inside the container projecting in front or back into the closable opening (2). In a variant, using two container parts of identical size made up from plates again by conversion. The three casing surfaces per container are joined at acute, obtuse or right angles to give the extension surface acting as base or rear wall and in this case both container parts are joined to give openings so the extensions close off the openings by flap or cover.
